Historical Perspectives of the Timed Barium Esophagram

- Prior tests using barium emptying within 24 hr of pneumatic dilation-Cohen test
- Idea originated with Bob Koehler at UAB to identify a better objective test to assess symptom improvement and esophageal emptying—at time just following symptoms
- Originally considered a nuclear medicine emptying test—Larry Johnson oatmeal test
- In real life, barium is easier and more similar to liquid retention in achalasia

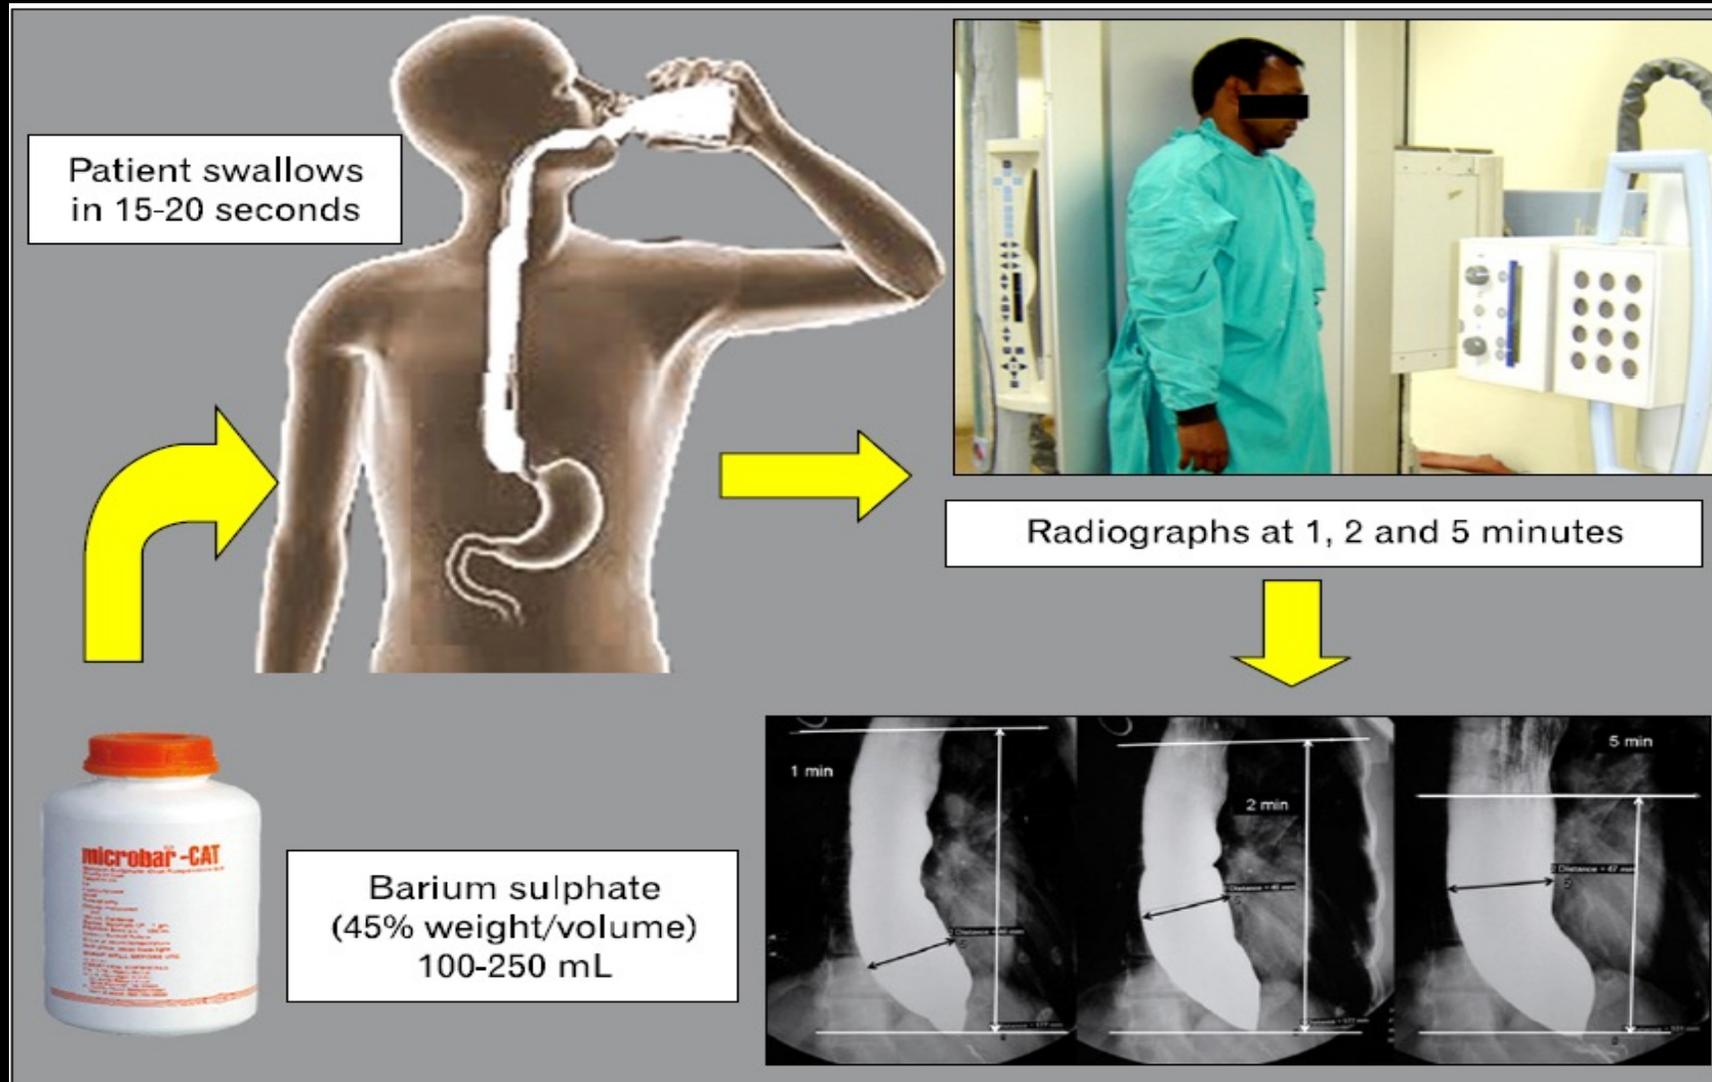

Timed Barium Swallow: A Simple Technique for Evaluating Esophageal Emptying in Patients with Achalasia

OBJECTIVE. Our purpose was to define a simple technique for timing a barium swallow by which radiologists can assess esophageal emptying in patients with achalasia before and after minimally invasive therapy. Our purpose was also to determine the best method of quantifying the degree of emptying using this timed technique.

MATERIALS AND METHODS. In the barium swallow technique, upright frontal spot films of the esophagus are obtained at 1, 2, and 5 min after ingestion of 100–200 ml of low-density (45% weight in volume) barium sulfate (volume of barium determined by patient tolerance). Forty-two of these barium swallows done by 23 patients with achalasia were retrospectively reviewed. The examination served either as a baseline study or as a 1-month follow-up study after patients had undergone pneumatic dilatation or *Clostridium botulinum* toxin injection. The spot films were digitized, and a region of interest was drawn around the column of barium by two observers. The change in area seen in the region of interest on the 1- and 5-min films served as the gold standard for percentage of emptying. The spot films were then analyzed by four other observers, each of whom independently, subjectively, and qualitatively estimated the percentage of emptying between the 1- and 5-min spot films. Percentages were divided into quintiles. On a separate occasion, each of these four observers also independently measured the height and width of the barium column on the 1- and 5-min spot films. The product of height times width seen on the 1- and 5-min films became the quantitative estimate for percentage of emptying.

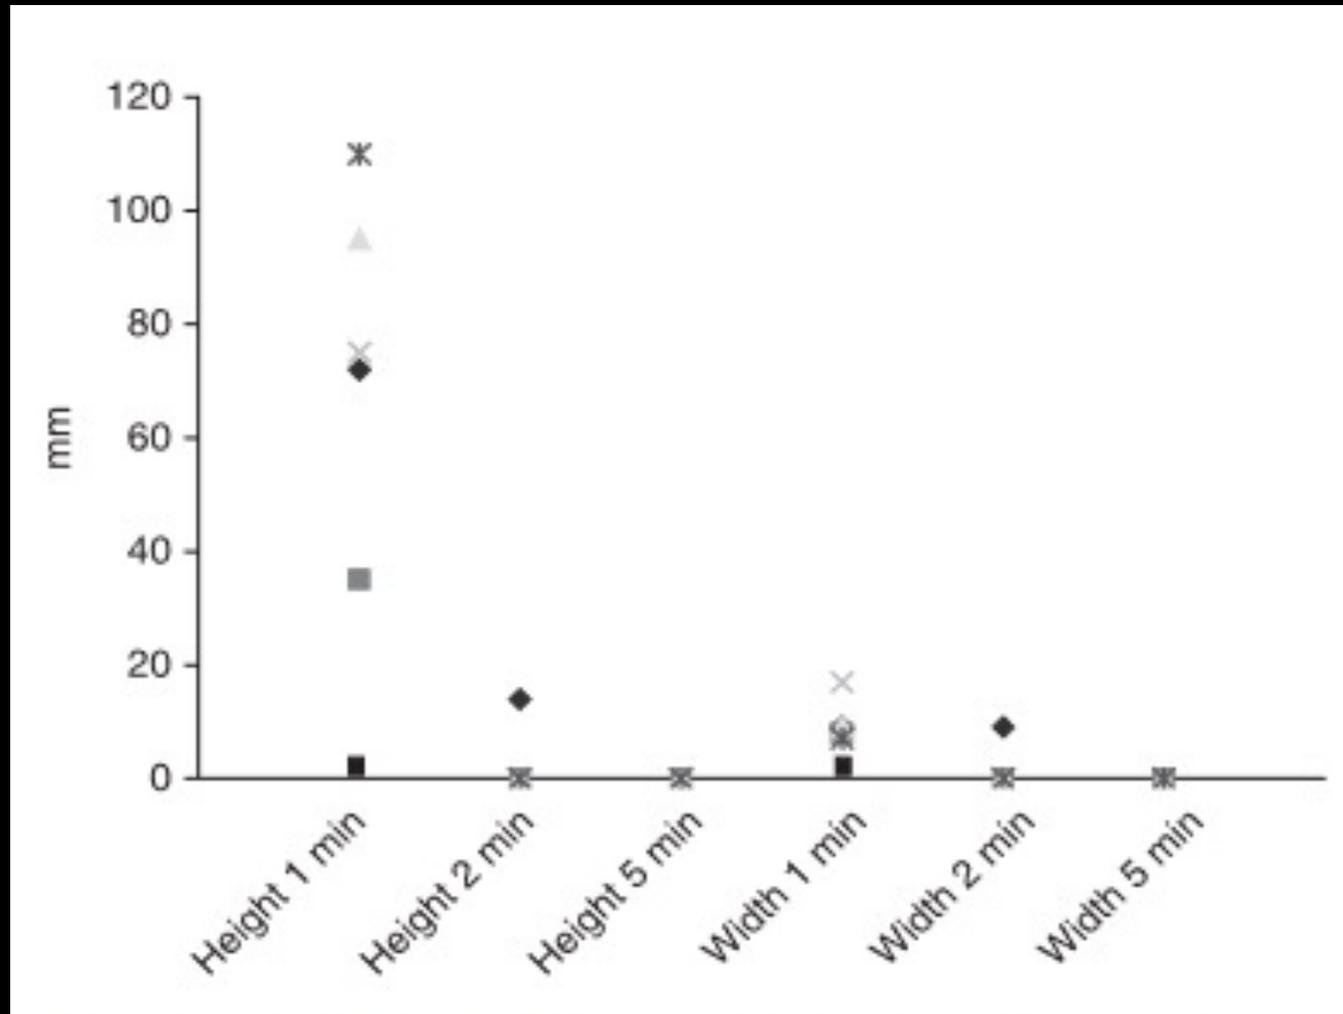

Technique of Timed Barium Esophagram

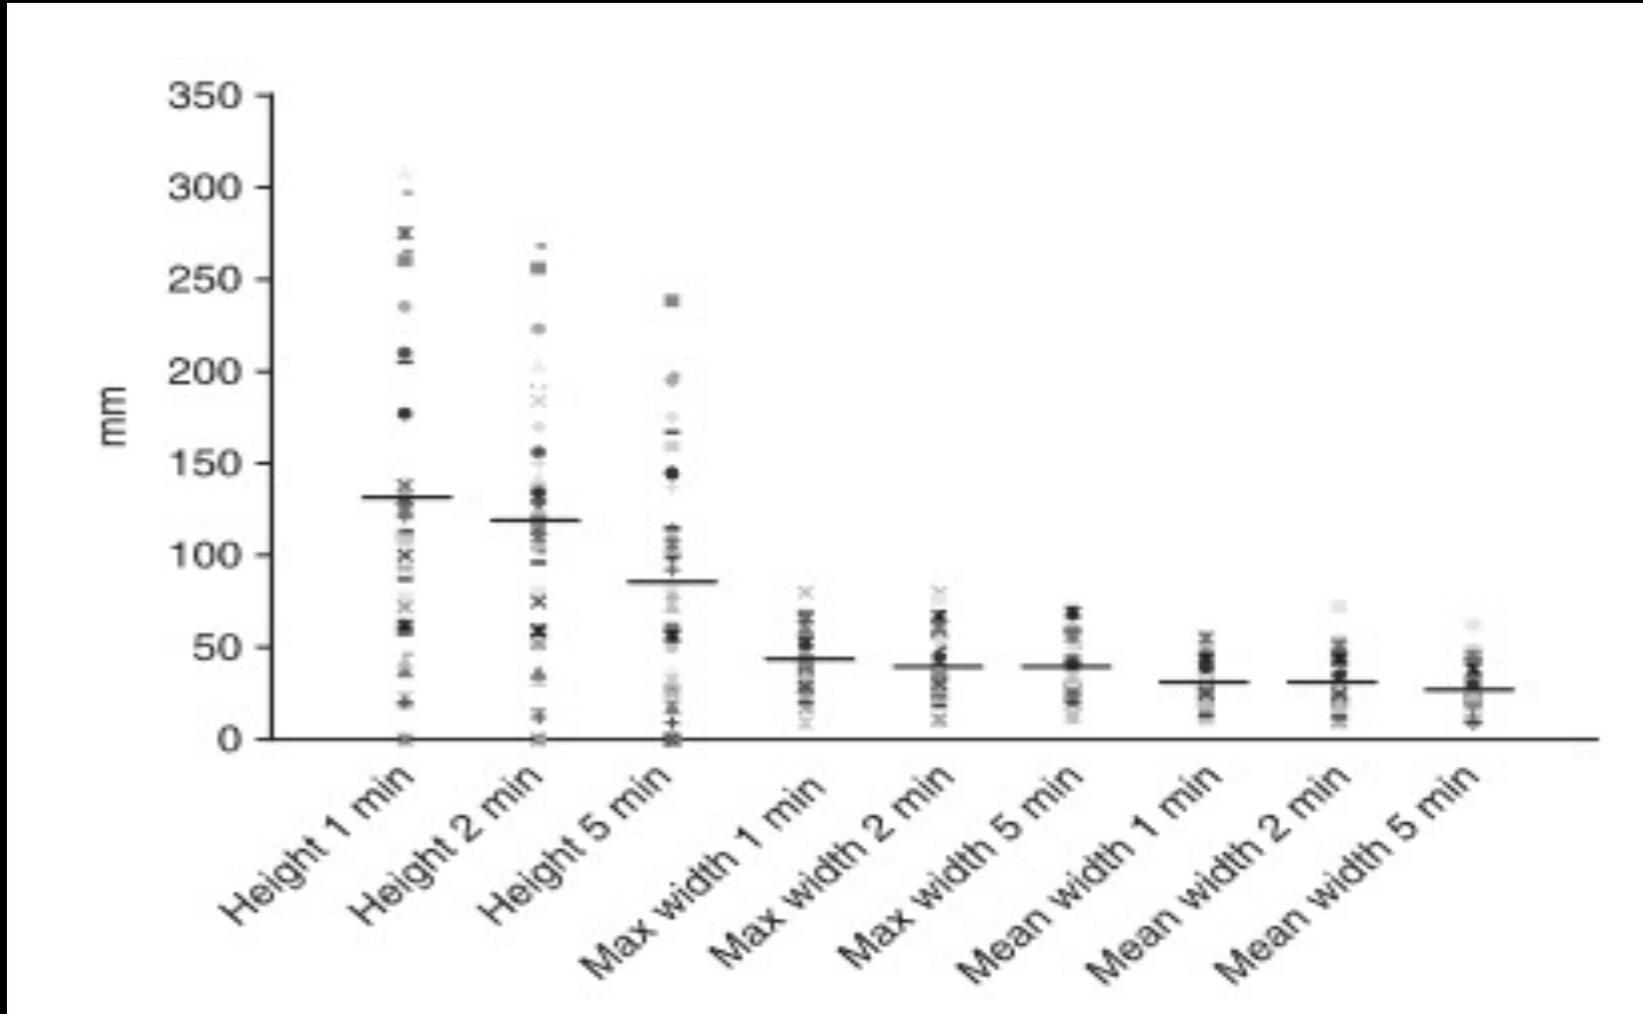

How to Analyze—Height, Width, Cross-Sectional Area or Percent Emptying?

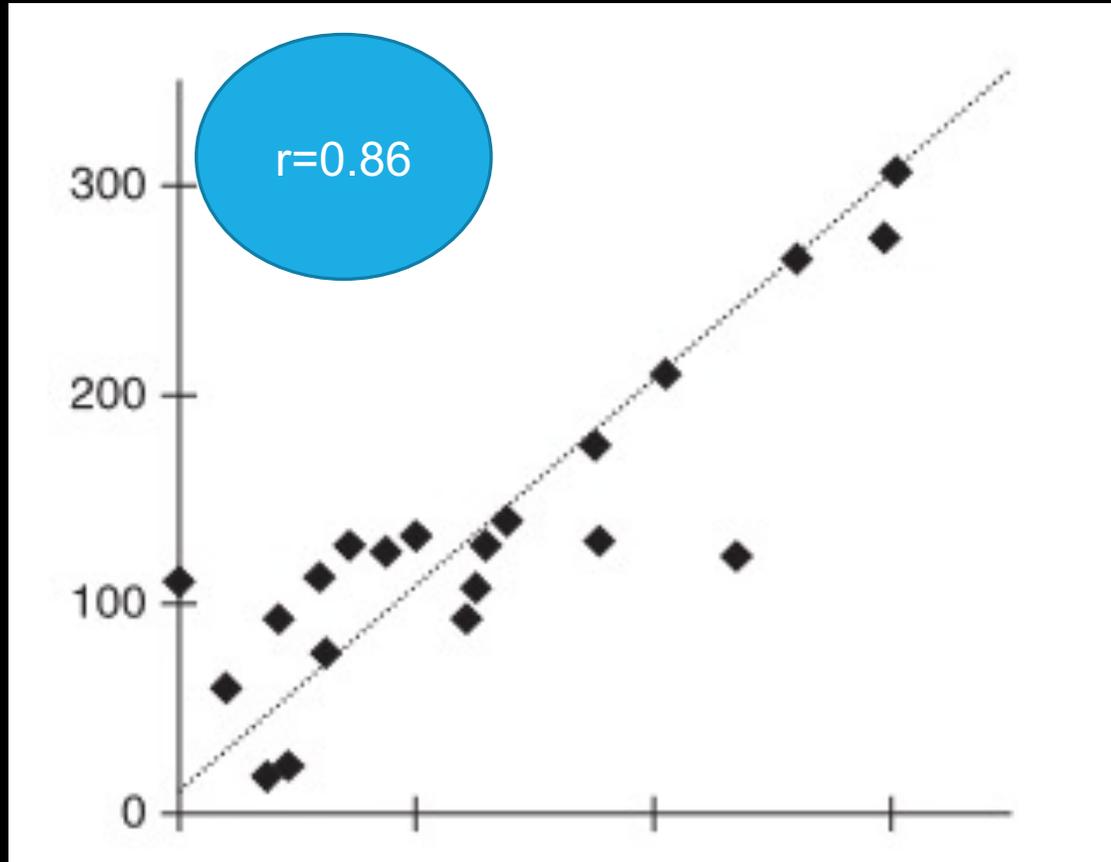

Individual TBE Parameters in 14 Healthy Volunteers

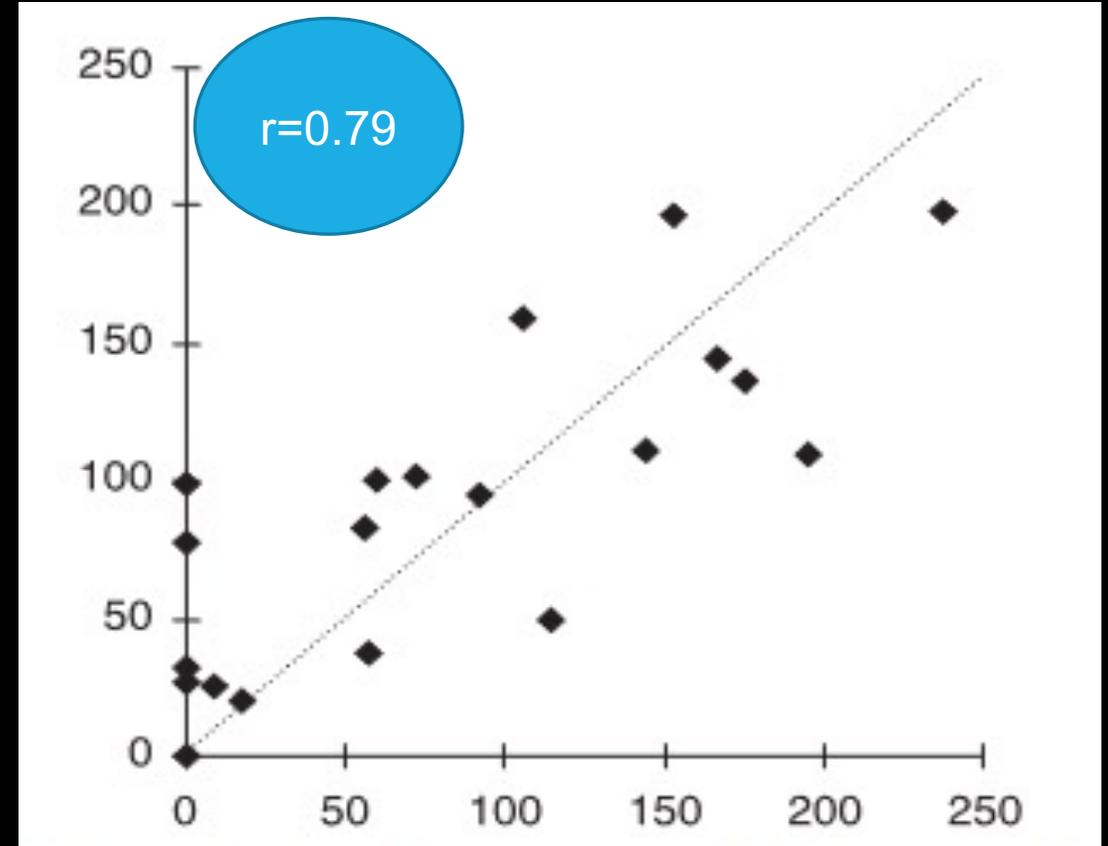

Individual TBE Parameters in 14 Achalasia Patients on Two Examinations

Correlation Coefficient of Barium Column Height on Repeated Exams

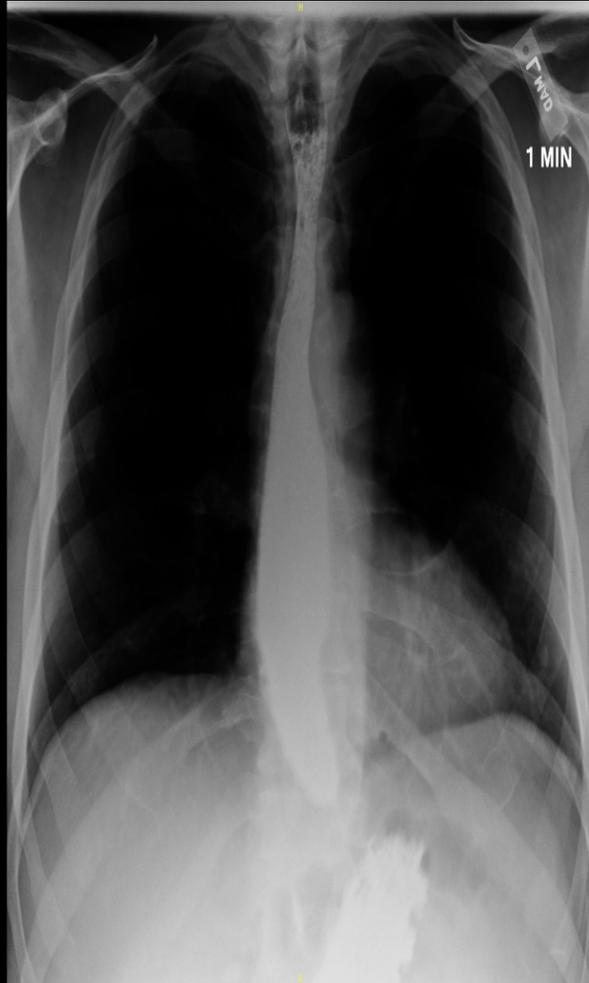

One Minute

Five Minutes

Current TBE Protocol at the University of South Florida

One Minute

Five Minutes

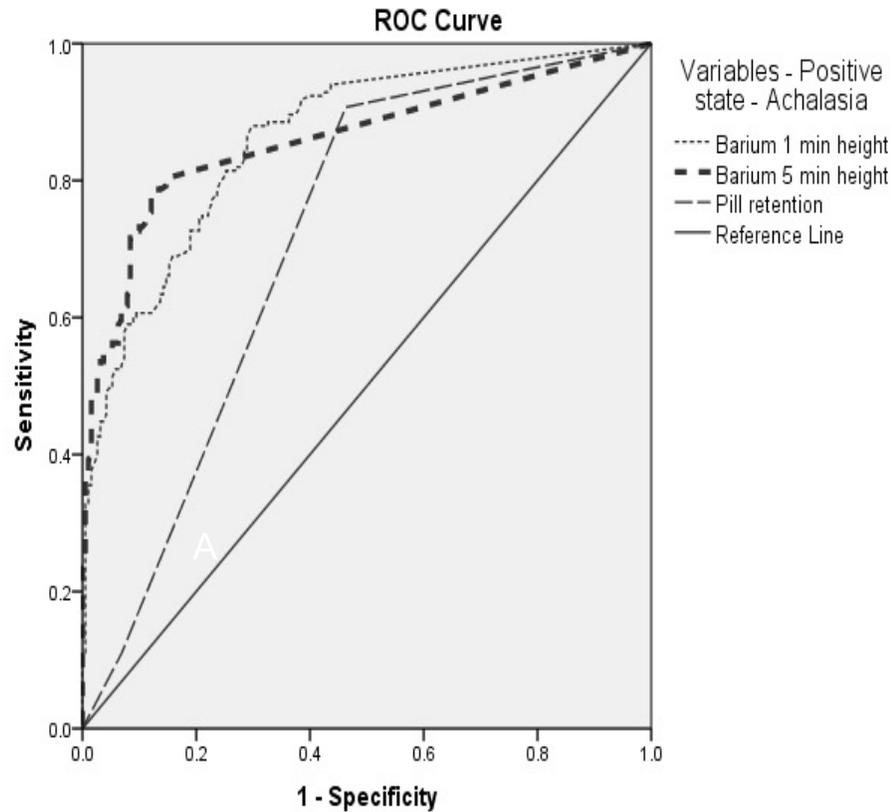

13 mm Tablet after 5 Minutes

What are We Actually Assessing with the Timed Barium Esophagram??

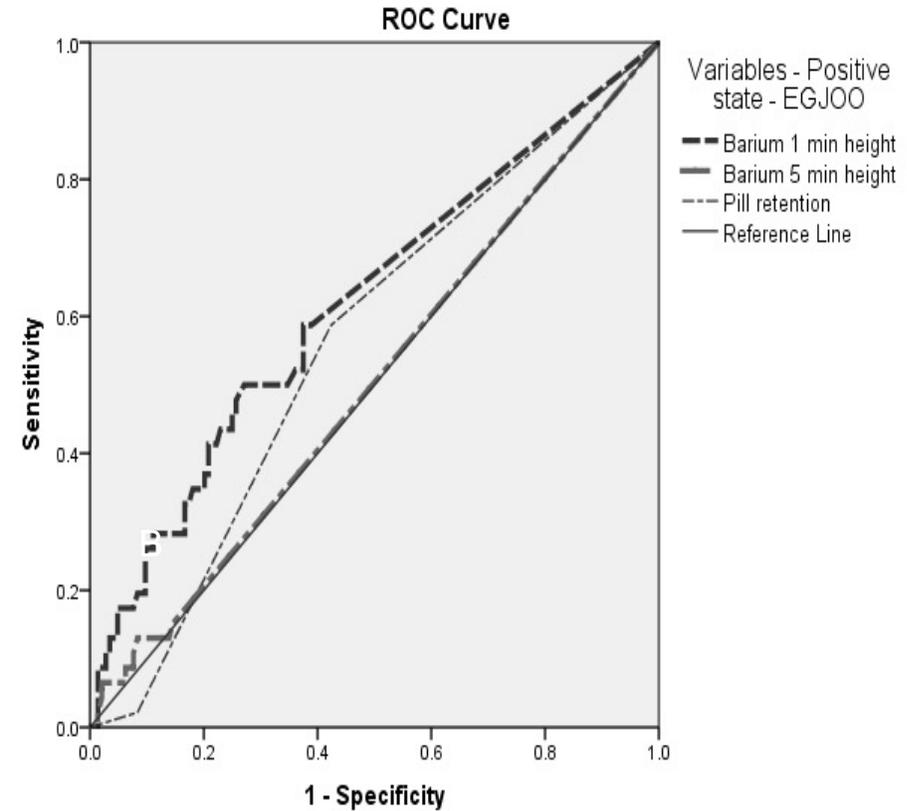

- Rate (degree) of esophageal emptying=compliance of EGJ
- Anatomy of the esophagus especially with obstruction

Accuracy of Identifying Achalasia in 107 Patients

Identifying Achalasia vs EJGOO vs non-Achalasia

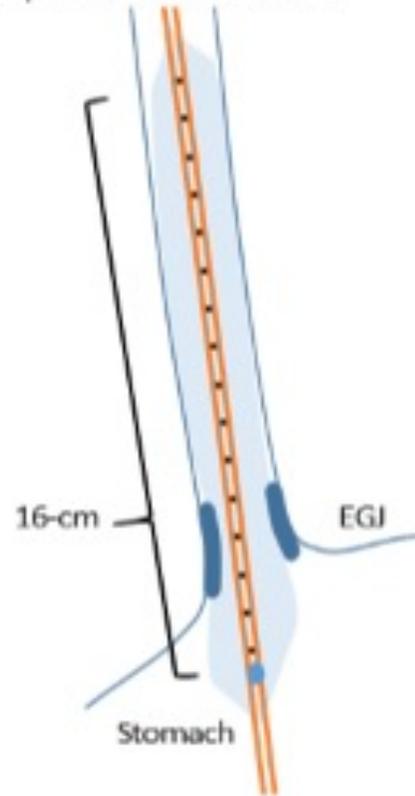

Identifying EJGOO vs non-Achalasia

Barium Ht >2 cm at 5 mins—85% sensitivity and 86% specificity

Type III Achalasia

Epiphrenic diverticulum

Clinical Applications of the Timed Barium Esophagram

- Achalasia
 - Supporting HRM diagnosis of achalasia
 - Resolving the up to 20% of inconclusive HRM diagnoses of achalasia with IRP < 15 mmHg (new Chicago 4.0)
 - Short and long term predictors of improvement post treatment
- EGJ outflow obstruction
- Non-achalasia dysphagia

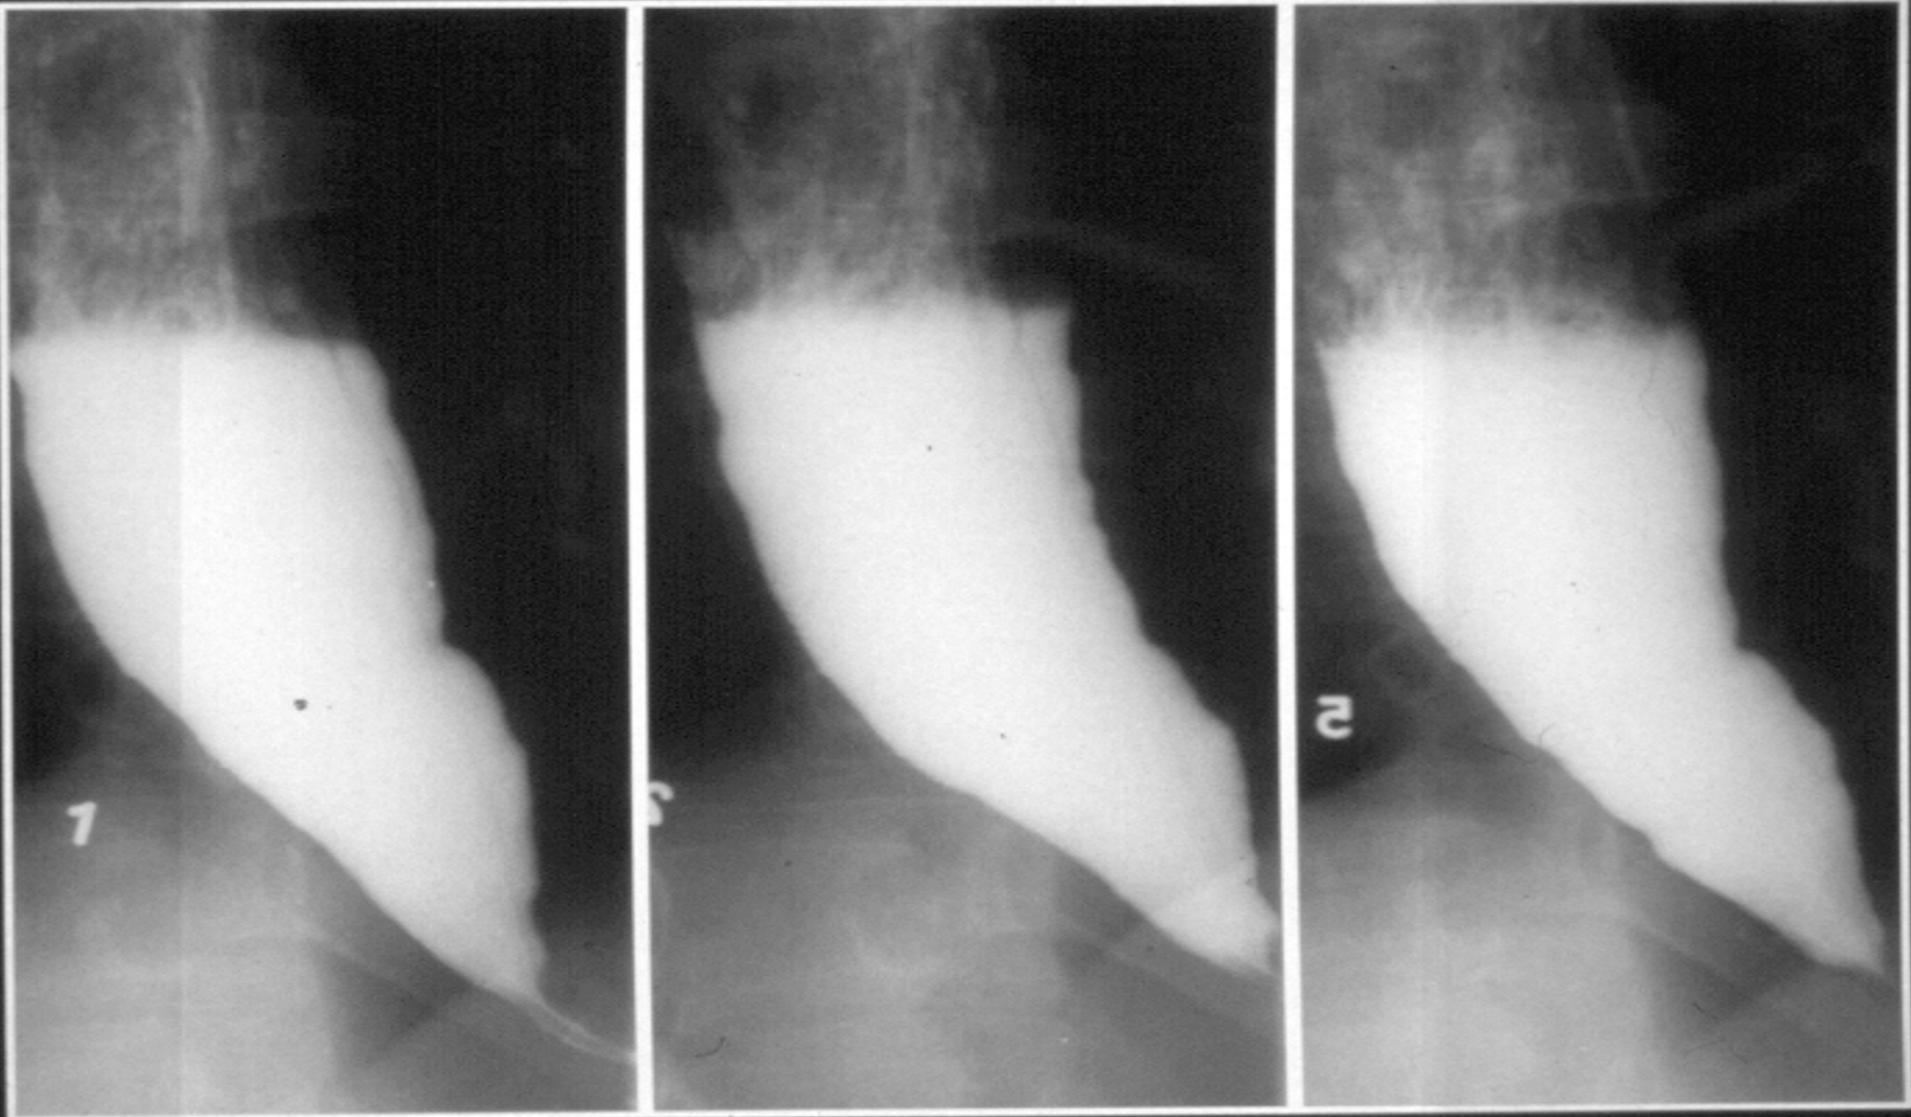

Accuracy of Time Barium Esophagram with 13 mm Tablet for Diagnosis of Achalasia

Table 2. Frequency of combined emptying of liquid barium and 13-mm barium tablet passage across groups

TBS variable	Achalasia, N=107	P value achalasia vs. EGJOO	EGJOO, N=45	Non-achalasia, N=132	P value	
					EGJOO vs. non-achalasia	Achalasia vs. non-achalasia
Liquid barium normal +tablet lodged	22 (20.5%)	0.001	22 (48.9%)	42 (31.8%)	0.049	0.057
Liquid barium abnormal+tablet lodged	80 (74.8%)	<0.0001	4 (8.9%)	7 (5.3%)	0.474	<0.0001
Liquid barium abnormal+tablet passed	5 (4.7%)	0.801	1 (2.2%)	3 (2.3%)	0.984	0.472
Liquid barium normal+tablet passed	0 (0%)	<0.0001	18 (40%)	80 (60.6%)	0.023	<0.0001
<u>Liquid barium abnormal and/or tablet lodged</u>	107 (100%)	<0.0001	27 (60%)	52 (39.3%)	0.0161	<0.0001

EGJOO, esophagogastric junction outflow obstruction; TBS, timed barium swallow.

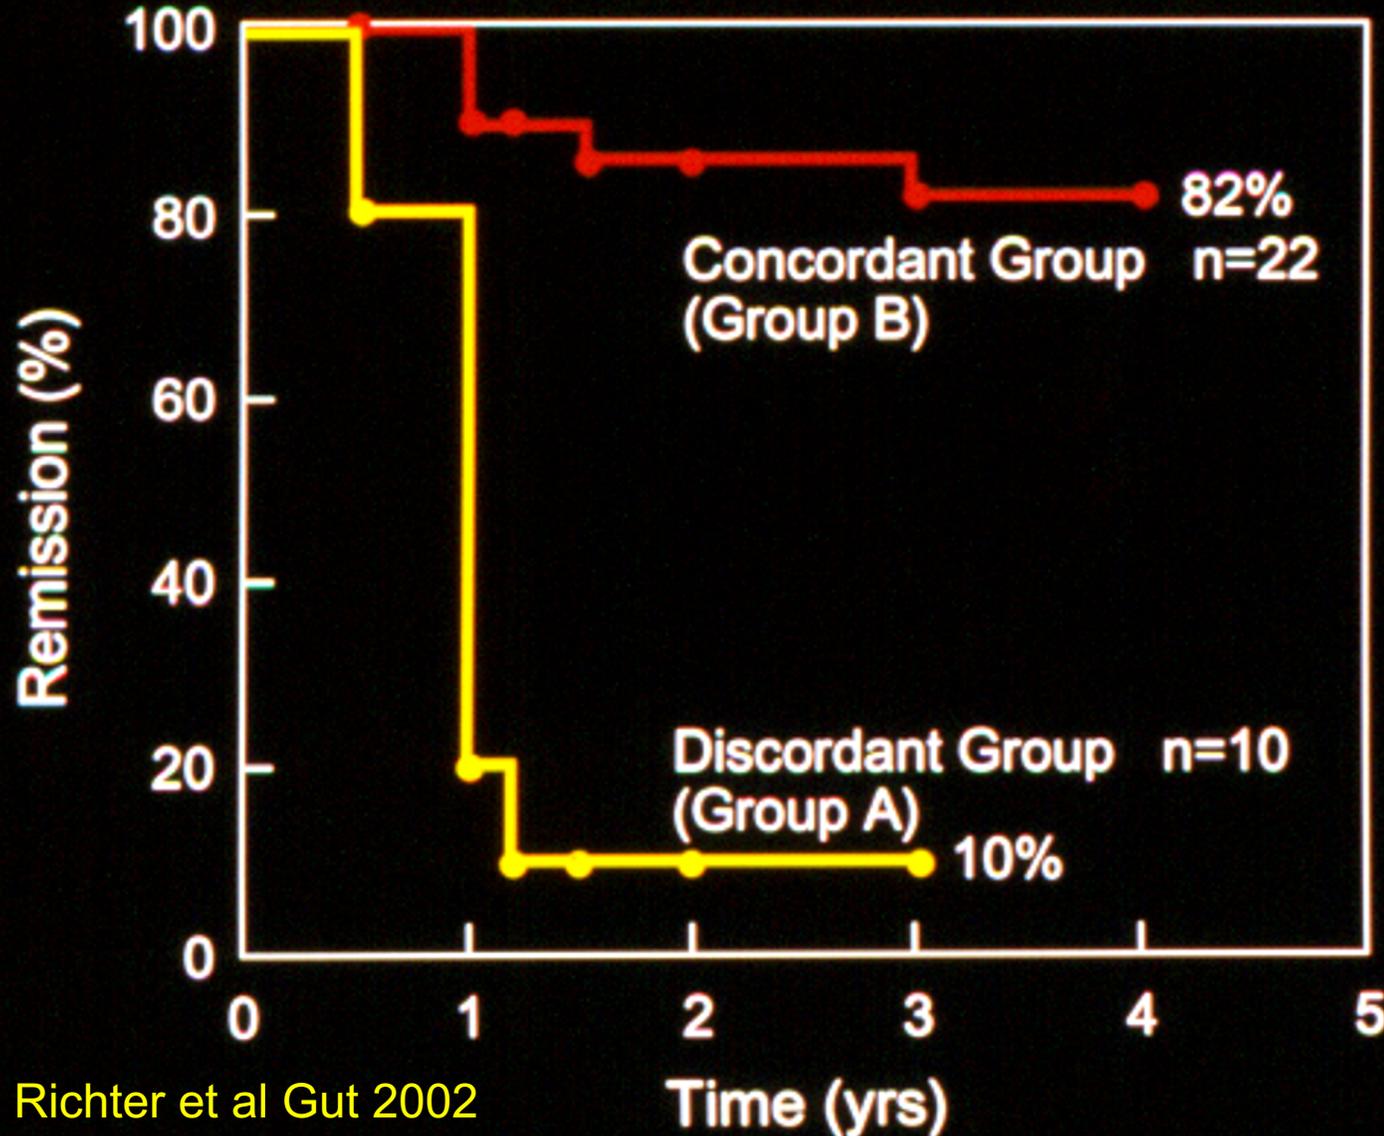

Timed Barium Esophagram before Treatment

Timed Barium Swallow after Successful Treatment

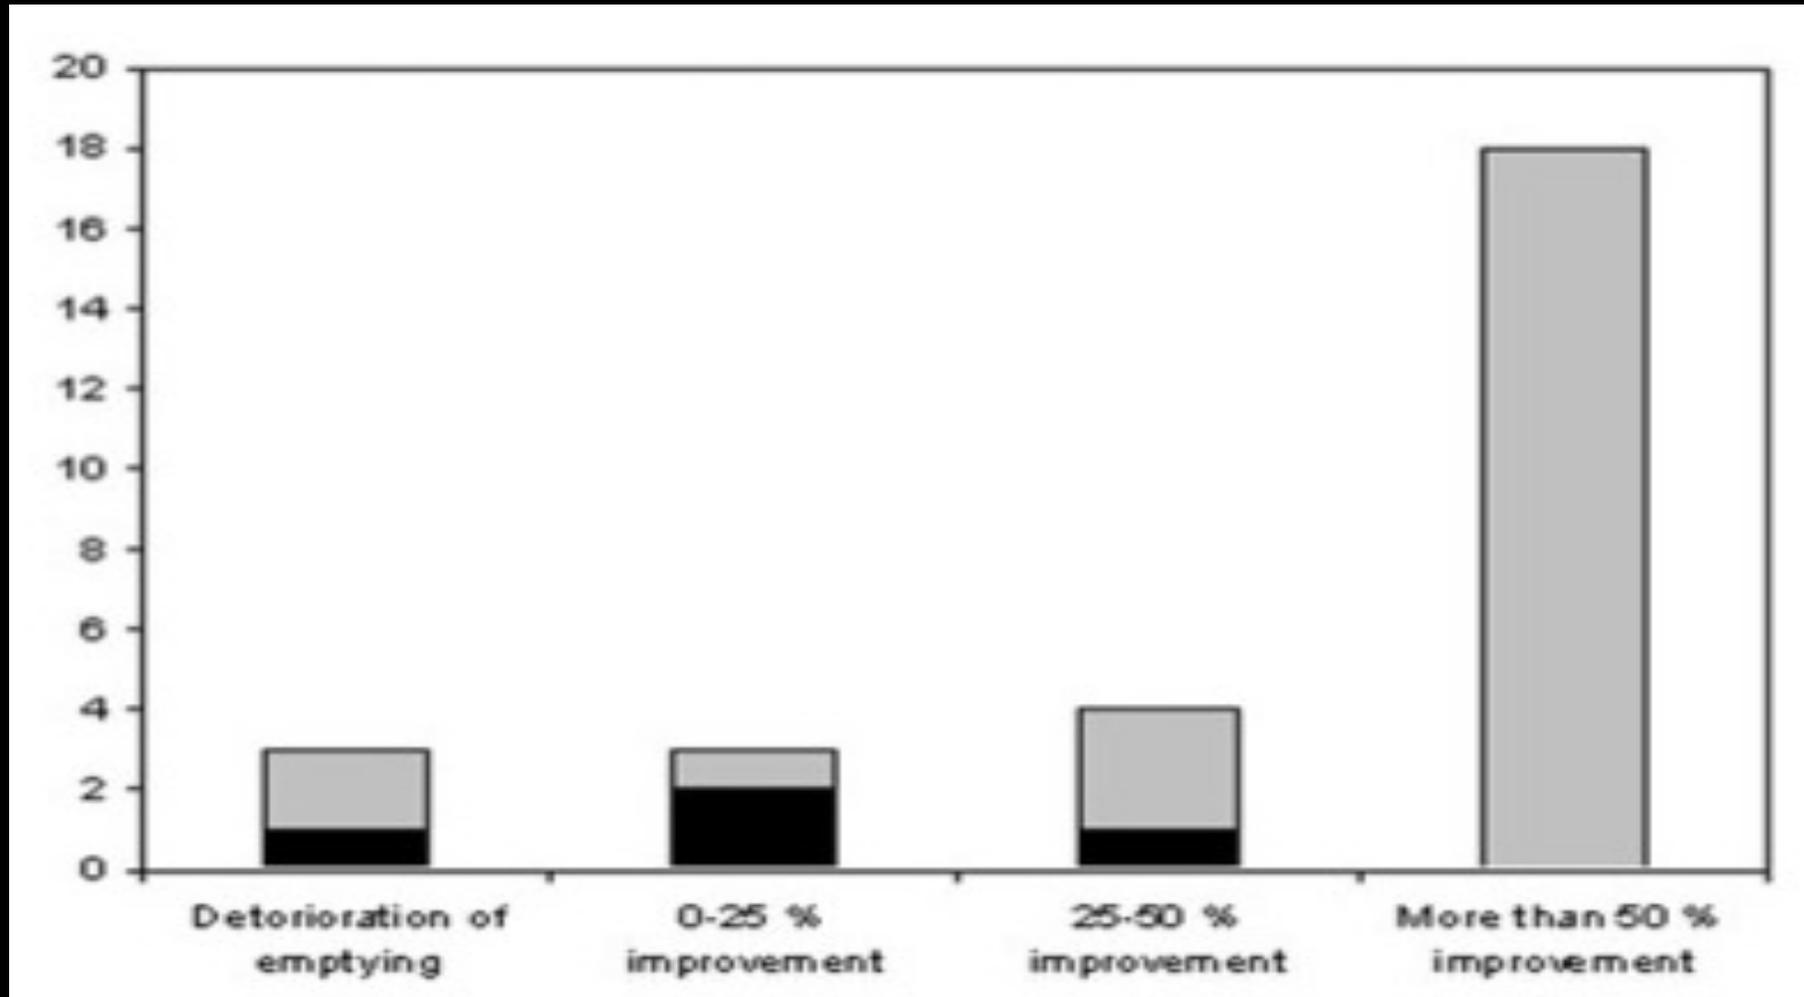

REMISSION RATE OF DISCORDANT AND CONCORDANT GROUPS

Definition of Remission

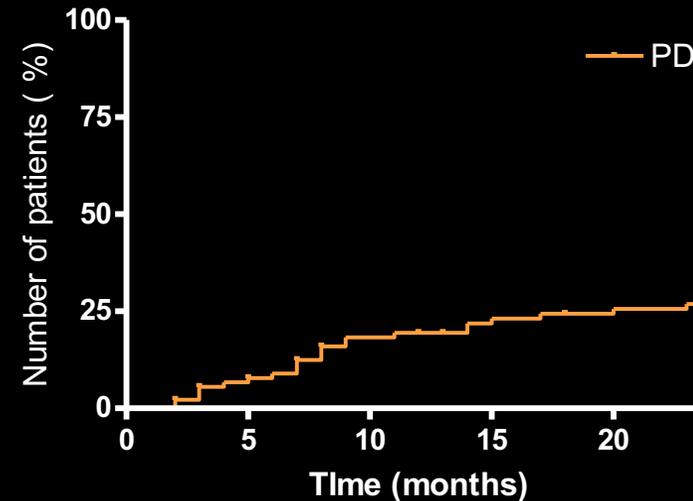

- No symptoms
- 90% empty
- <5 cm barium ht at 5 min on post treatment

Frequency of Surgical Failure Parrallels Improvement at 1 Minute in Barium Height

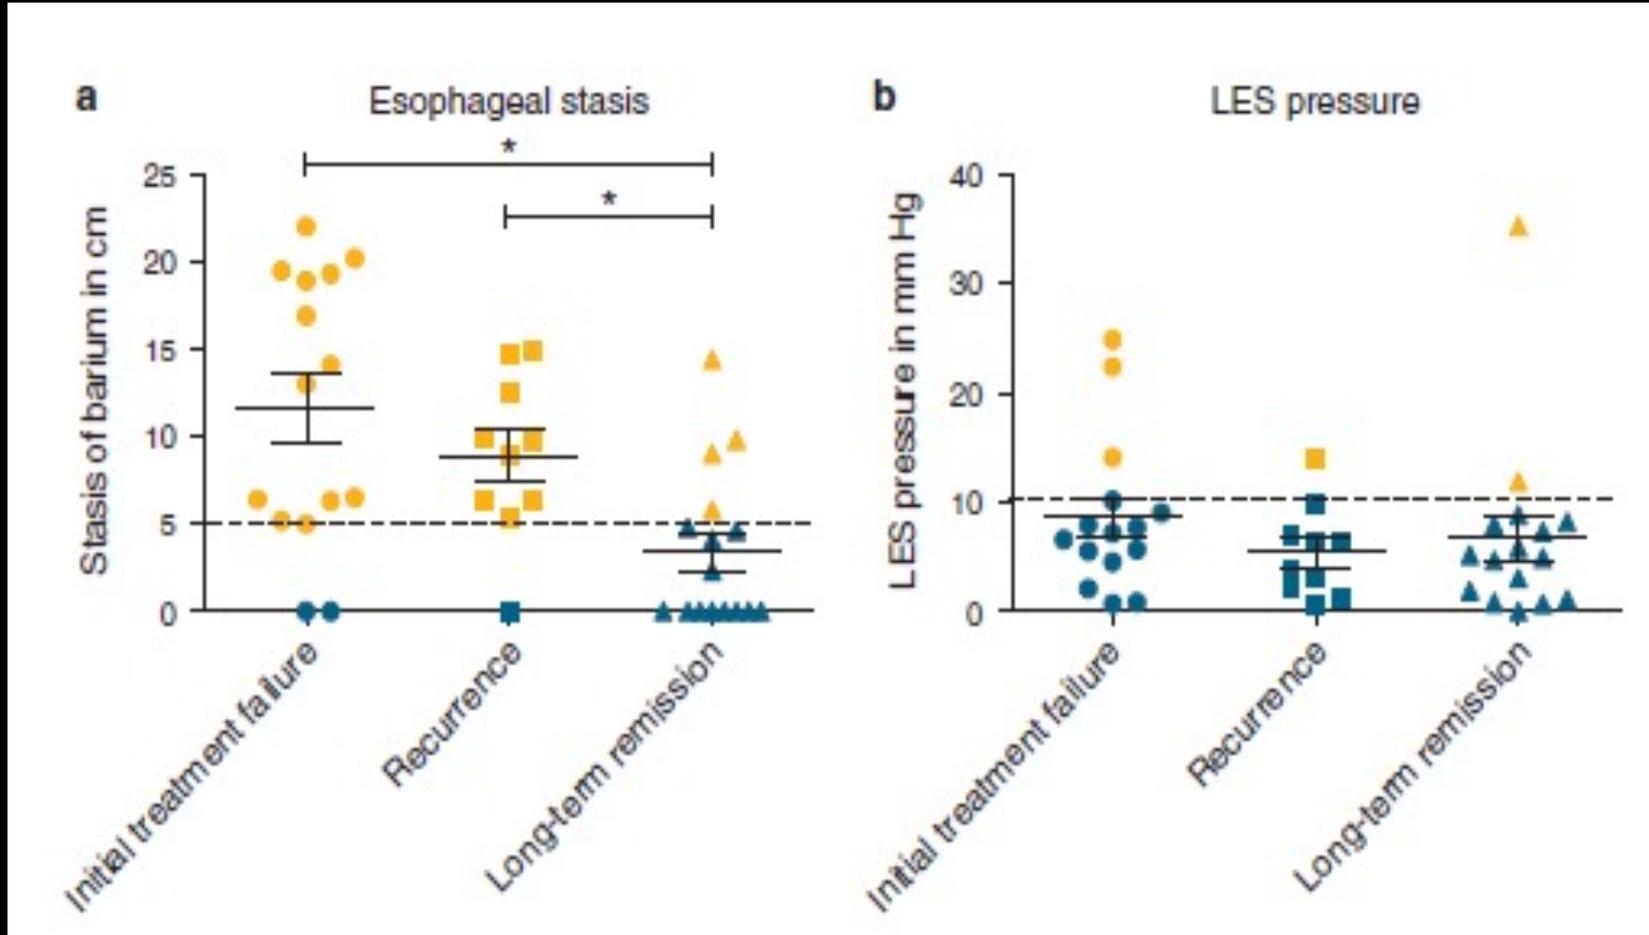

SECONDARY OUTCOME PARAMETERS NEED FOR REDILATION IN PD GROUP

Factor	Hazard Ratio
Age > 40:	0.23 (0.09-0.56)
Daily chest pain:	4.3 (1.6-11.4)
Posttreatment (3 months) >10cm stasis (5 min)	5.3 (1.3-22)

Esophageal Stasis on TBE Predicts Recurrent Symptoms in Long-Standing Achalasia-41 Patients

Average fu—17 yrs

Why Should the Esophageal Community Embrace The Timed Barium Esophagram?

- Everyone can do it, cheap, easy, reliable and easy to start
- Not expensive, doesn't require another endoscopy
- USF—do HRM and TBE –then see the patient
- **“Old is not bad and sometimes better than new”**

Thank you
